EXPERIMENT 3B

ROLL NO: 240701189

Create a prototype with familiar and unfamiliar navigation elements and evaluate ease of use with different user groups using Wireflow.

Aim

The aim of this experiment is to design a prototype containing both familiar and unfamiliar navigation elements and visualize the navigation flow using Wireflow.

Introduction

Prototype design helps visualize an application's structure before development. Wireframes show screen layouts, while wireflow shows navigation between screens. In this experiment, a Student Information Management System prototype is designed using Wireflow.

Tools Used

1. Proto.io
   Proto.io is a prototyping tool used to design interactive mobile application interfaces.
2. Wireflow
   Wireflow is an online tool used to create wireframe flow diagrams and visualize navigation between screens.

Prototype Design

The prototype designed in this experiment represents a Student Information Management System.

1. Login Screen

The login screen is the entry point of the application. Users enter their username and password to access the system. This screen allows authentication before accessing other features of the application.

2. Dashboard Screen

After logging in, users are taken to the dashboard screen where they can access different options such as adding, viewing, searching, updating, and deleting student records.

3. Add Student Screen

When a user selects the add student option, the application displays a form to enter student details. This screen includes fields such as student name, register number, course, and marks.

4. View Students Screen

In this screen, the application displays the list of students. Users can view all stored student records in a structured format.

5. Search Student Screen

This screen allows the user to search for a specific student by entering the student name or register number. The system displays the relevant student details.

6. Update/Delete Student Screen

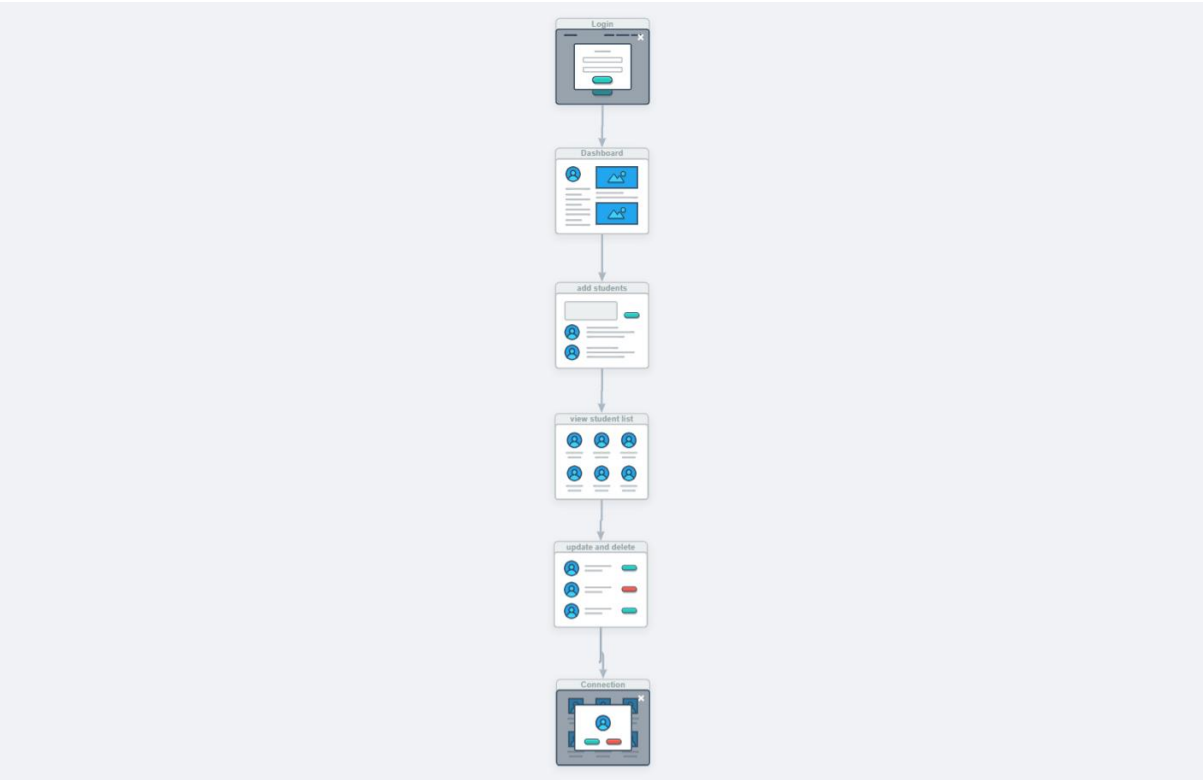
When a user selects a student record, the application allows updating or deleting the information. Users can modify details or remove records from the system.

7. Logout Screen

After completing operations, the user can log out of the system safely.

Wireflow Design

The wireflow diagram shows how a user moves from one screen to another while using the application.



The navigation flow of the Student Information Management System is as follows:

Login Screen → Dashboard Screen → Add Student Screen → View/Search/Update/Delete Screen → Logout Screen

This flow helps understand the sequence of user actions during the system usage.

The wireflow diagram visually represents these screens and their connections, making it easier to understand the structure of the application.

Advantages of Using Wireflow

Wireflow provides several advantages during the design process:
- Helps visualize the navigation structure of an application
- Makes it easier to understand user interaction flow
- Improves communication between designers and developers
- Helps identify design problems before development
- Saves time and effort during the development process

Conclusion

This experiment helped in understanding how to design a prototype and represent navigation flow using Wireflow. It also helped in visualizing how users interact with different screens in a Student Information Management System.
