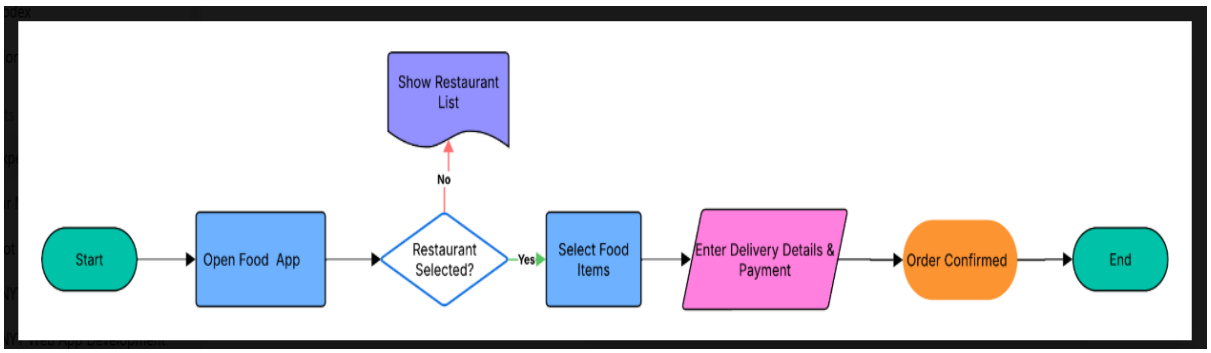
EXPERIMENT 4a

Conduct task analysis for an app (e.g., online shopping) and document user flows. Create corresponding wireframes using Lucidchart

NAME : Hemalatha ST

REG NO:240701189



1. Overview

This document explains the process flow represented in the flowchart of a food ordering application. The flow illustrates how a user interacts with the system from opening the app to successfully placing an order.

2. Flow Summary

The process follows a linear sequence with a decision-making step for restaurant selection.

High-level sequence:
Start → Open Food App → Restaurant Selection → (If No → Show Restaurant List) → Select Food Items → Enter Delivery Details & Payment → Order Confirmed → End

3. Step-by-Step Explanation

3.1 Start

- Entry point of the system
- Represents the beginning of user interaction

3.2 Open Food App

- User launches the food ordering application
- Initial screen of the system is displayed

3.3 Restaurant Selected? (Decision Node)

- Represented by a diamond shape
- Checks whether the user has selected a restaurant

Outcomes:

- **Yes** → Proceed to food selection
- **No** → Display restaurant list

3.4 Show Restaurant List

- Displays available restaurants to the user
- User can browse and choose a restaurant
- Once selected, flow continues

3.5 Select Food Items

- User selects desired food items from the menu
- Items are added to cart
- Acts as a core interaction step

3.6 Enter Delivery Details & Payment

- User enters:
    - Delivery address
    - Contact details
    - Payment method
- Final step before confirming order

3.7 Order Confirmed

- System confirms successful order placement
- User receives confirmation message

3.8 End

- Represents completion of the process
- User journey ends

4. Flow Characteristics

- Linear flow with one decision node
- Conditional branching for restaurant selection
- Clear progression from start to order completion
- Single entry and exit point
- User-driven navigation

5. Logical Interpretation

1. User opens the application
2. System checks if a restaurant is selected
3. If not, user selects from restaurant list
4. User chooses food items
5. User enters delivery and payment details
6. Order is confirmed
7. Process ends

6. Conclusion

The flowchart represents a simple and efficient food ordering process. It ensures smooth navigation with minimal complexity while handling decision-making through restaurant selection. The structure provides a clear understanding of user interaction within the system.
